AMZAD FOOD

Project Scope & Quotation

Prepared for: Amzad Food

Prepared on: 24 October 2026

Proposed project fee: USD $200 — negotiable

Service: Figma design system, website UI design, frontend implementation and developer handoff

Status: Proposed scope for client review

1. Project overview

The Amzad Food project covers the customer-facing website from its design foundations in Figma through UI design and frontend implementation using Next.js, React and TypeScript. The scope includes a project-specific design system, the agreed storefront screens, responsive frontend interactions and a documented handoff to the client's backend developer.

The proposed total fee is $200 and is open to negotiation. It covers the design-to-frontend scope described below. The final amount will be agreed before acceptance. Live ecommerce services require separate backend development and integration.

2. Figma design system and UI design

- Project color palette, typography hierarchy, spacing, corner-radius and shadow styles.
- Reusable components for buttons, form fields, product cards, badges and shared navigation, with relevant interaction states.
- Organization of styles and components within the project Figma file for consistent use across the agreed screens.
- Customer-facing UI designs for the screens listed below, including desktop and mobile layouts.
- Implementation of the agreed designs in the frontend, with layout adjustments for tablet widths.
- Editable Figma file access or an agreed transferable copy, including the project design system and screen designs.

This is a design system for the Amzad Food storefront. A separate enterprise component library, additional brands/themes and admin dashboard designs are outside this scope.

3. Included screens and features

Area	Included deliverable
Homepage	Existing hero, category navigation, product sections, brand/story sections and footer
Product catalog	Existing product grid, local search, category filters and pagination
Product details	Product images/gallery, catalog pack and price, information tabs and related products
Quick View	Product preview, quantity selection, add-to-cart and checkout navigation
Shopping cart	Add/remove products, adjust quantities and display estimated totals using frontend data
Checkout	Customer/address form, frontend validation, existing promotional calculations, COD presentation and clearly identified local order preview
My Orders	Existing order-list design, status filters, empty state and device-saved preview records
Order tracking	Lookup interface, order-detail layout, status timeline and existing HTML invoice presentation using local/sample data
Blogs	Existing blog listing and article layouts
FAQ	Existing FAQ page and interactions
Shared interface	Header, footer, mobile menu, account-form layout, wishlist interface and scripted support widget

The agreed Figma screens and corresponding project screenshots define the visual baseline for frontend delivery. Product and article detail pages reuse templates; the fee does not include a separately designed page for every item.

4. Frontend implementation and verification

- Responsive implementation of the agreed layouts for mobile, tablet and desktop.
- Correction of reproducible frontend defects within the included screens.
- Checks of navigation, images, cart actions and form validation in a current Chrome desktop browser and a mobile viewport before final acceptance.
- TypeScript checking and a successful production build.
- Check of local links and asset targets in the exported website.

These checks cover the supplied frontend. Server behavior, payment processing, account security and real order fulfillment are outside this scope.

5. Functional boundaries

Feature	What this delivery provides	What requires separate work
Products	Display from existing local catalog data	Product database, admin editing, live inventory and backend-issued IDs
Cart	Browser-based cart interactions	Account synchronization and server stock validation
Checkout	Form, estimated totals and device-only preview	Persistent real orders, authoritative pricing and order notifications
Customer accounts	Account interface with unavailable services clearly identified	Real login, registration, sessions, OTP and password recovery
Orders and tracking	Existing layouts and labeled preview behavior	Customer-authorized API access, live statuses and courier updates
Reviews and wishlist	Existing frontend/local interactions	Shared persistence, moderation and cross-device synchronization
Newsletter and chat	Offer-preview interface and scripted support	Subscription service, messaging platform or live support backend

Local browser storage and sample records are demonstration mechanisms. They do not constitute a production order system. API connection work is not included in this $200 quotation.

6. Revisions and support

One consolidated revision round across the design and frontend scope is included. The client supplies one combined list of minor changes to text, colors, spacing or replacement images within the agreed layouts. Approved design changes will be reflected in the corresponding frontend screens.

New pages, new features, changed user flows and major layout redesigns require a separate estimate. Corrections to reproducible defects within the agreed scope do not consume the revision round.

Seven calendar days of handoff support begin when the final deliverables are handed over. This covers setup questions, explanations of the existing code and clarification of integration points. It excludes implementing APIs, building additional features and ongoing maintenance.

7. Deliverables

1. Editable Figma design file or agreed copy containing the project design system, reusable components and agreed desktop/mobile screen designs.
2. Frontend source code in the agreed repository or source archive.
3. README with installation, local execution and build instructions.
4. Backend handoff notes identifying data flows and integration points.
5. Proposed API contract for discussion with the backend developer; it is not an implemented API.
6. Frontend audit record with completed checks and outstanding dependencies.

Admin dashboard design and implementation are excluded unless separately agreed in writing.

8. Client responsibilities

The client supplies and approves final product names, pack sizes, prices, images, descriptions, contact information and business policies. Existing placeholder or sample content must be approved, replaced or excluded before a live launch.

The client assigns a backend developer for real ecommerce functionality and provides any access required for the agreed source-code handoff. The client consolidates feedback into the included revision round.

9. Exclusions

- Backend services, API integration, database setup and data migrations.
- Admin dashboard design, frontend or backend implementation.
- Real authentication, OTP, password recovery and social sign-in.
- Live order processing, inventory management, courier integration and payment gateways.
- SMS, email, newsletter platforms and live-chat services.
- Domain registration, hosting, production deployment, server configuration and ongoing monitoring or maintenance.
- Third-party subscriptions, service charges and transaction fees.
- New branding, original photography, copywriting, translation or bulk product/article entry.
- Additional screens, major redesigns and functionality introduced after scope approval.

10. Fee and proposed payment schedule

Milestone	Amount
Scope acceptance / initial payment	50% of the agreed fee
Final design and frontend acceptance, before final file/source handover	Remaining 50%
Proposed total fee — negotiable	**$200**

The final negotiated fee will be recorded in the approval section. If agreed at $200, the two payments will be $100 each. Third-party charges are excluded. If payment is made in BDT, both parties will agree the BDT amount before payment. Delivery dates will be agreed after receipt of the required content and consolidated feedback; no completion date is committed by this document.

11. Acceptance and scope changes

Delivery is accepted when the Figma design system and agreed screen designs are supplied, the frontend reflects the visual baseline, included interactions pass the stated checks, the production build succeeds and handoff documentation is provided. Outstanding backend dependencies are recorded separately and do not represent included live functionality.

Any request beyond this scope must be described and priced before additional work begins. Changes to price or delivery dates require agreement from both parties.

12. Approval

Client name: _____

Developer name: _____

Scope acceptance date: _____

Agreed delivery date: _____

Final agreed fee (USD): _____

Approval confirms agreement on the Figma-to-frontend scope, the final negotiated fee, exclusions, revision allowance and payment schedule. This document remains a proposal until accepted by both parties.
